

SOIL FOOD WEB

In a spoonful of garden soil there are **BILLIONS** of different living organisms – **INDUSTRIOUS ORGANISMS** that make your soil a better place for plants to grow.

As organisms consume other organisms, **nutrients convert from one form to another** and are **made available to plants** (grass, trees, shrubs, agricultural crops) and other soil organisms. They improve soil structure and **increase nutrient retention**, among many other things.

The organic contents of soil must be **REPLENISHED CONSTANTLY** as plants consume soil elements and pass them up the food chain.
